REMARKS

25X1

1. On 12 December 1950 a steel railroad bridge was seen just west of a railroad station west of Czeremcha (S 53/C 52). The name of the bridge and of the river it spanned could not be determined. The bridge, which had an estimated length of 200 meters and an estimated width of 8 meters, had been rebuilt. It had one standard-gauge track with wooden ties. The four spans rested on three concrete piers. The bridge was about 15 meters above water level. The river banks were steep. The bridge could be crossed at full speed. *

- * Comment. The bridge is on the double-track Siedlce-Czeremcha line. Its pin-point location could not be determined. The structure seems to be located just west of Nurzec, which is the nearest station west of Czeremcha.
